KEYMACRO Features: Automatically collects the data from Keystroke Logger, uses it to create individual emails for each log record The program also supports multiple PCs. (Added:12-12-2009) In the early days of the pc, ordinary computer users were allowed only to run very simple programs. One of the first applications was just a calculator, and it was fun to use. Then, around 1980, applications like word processors and spreadsheets started to appear. The difference with these programs was that ordinary users could edit them. A few years later, the introduction of personal computers connected to the internet allowed ordinary users to post their own programs and share them with others. These developments gradually transformed the ordinary user into a computer user. Later, with the introduction of smartphones and tablets, ordinary users started to demand more. As these technologies became mainstream, programmers started to develop apps for everyday life, and ordinary users started demanding various features from their applications. In fact, more and more app developers started to offer users more advanced features in their programs. And ordinary users started to expect more from their apps. No wonder there has been an enormous change in the development process of smartphone apps. Ordinary users have now become "app developers". The most recent development in the smartphone software development industry is the rise of app development platforms. There are numerous app development platforms, and the different platforms have different features, from how to easily design apps to how to manage the creation process. The most popular app development platforms include APK, Xamarin, and Unity. One of the most successful app development platforms is the Ubuntu based Xamarin, which was created by Microsoft. PDO: Prepare - Insert I have a situation where I am trying to insert values into a MySQL table that has an auto incrementing primary key ID. Here is the code that works fine: \$statement = \$pdo->prepare('INSERT INTO dudes (Name, Image, State, City, Zip, Updated) VALUES (?,?,?,?,?)'); \$statement->execute(array(\$name, \$image, \$state, \$city, \$zip, \$updated)); As you can see, I used the VALUES (?,?,?,?,?) syntax, and it works fine. Here is my code that does not work: \$statement = \$pdo->prepare('INSERT INTO dudes (Name, Image, State, City, Zip, Updated) VALUES (?,?,?,?,?)'); \$statement->execute(array(\$name, \$image, \$state, \$city, \$zip, \$updated)); Here is the class where I do this. public function insert(\$stmt, \$name, \$image, \$state, \$city, \$zip, \$updated) { \$statement = \$this->pdo->prepare(\$stmt); \$statement->bindValue('name', \$name, PDO::PARAM_STR); \$statement
