Date Added: 12-31-2008 Ease of Use: Value: Recommendation: After use it for just a few days, I realized it worked better than all other settings I've tried. Instructions: Ok, so I have been using Amprobe 3.7 for a while, but I have since updated to Amprobe 3.81, and when I did, it told me I had a virus and would I like to scan for it. I skipped this, since that scan was flawed, and instead, decided to browse their website, and tried to install Power YMF, but since my sound card wasn't listed on the page, the installer wouldn't recognize it. It only recognized my wireless internet thing (dongle, I think it's called) That, and when it started up, there was no output from the speakers. After finding this, and downloading the installer file, I tried it, and it gave me two "Auto-Configurations:" one was "on" the other was "off". I tried both, and one would hang for a bit, then eventually stop, and the other would start, only to hang. I tried disabling my AC'97 and HD audio controller on the motherboard, and then went to the software center and downloaded "C-Media USB Audio Manager". I ran that, and found an autoconfiguration for my sound card. I set the MSIDC option, and the volume up option. (I had the volume down off completely, so to have it auto configure to that setting, it turned on my volume) When I used the volume slider, the sound stayed at the default level. I couldn't find any other options, so I rebooted, and now the Autoconfiguration is on, and the volume up has changed to my sound card's volume level. It's not perfectly working, and I have to restart in order to make it work, but this is definatly superior to having no sound at all. It is also way better than all the other setting that I had tried. I would give it 5 stars if I could, but the problem I have with this being 5 stars is that my sound card's manual says that it should have a monitor of a higher volume, but instead, it automatically lowers my volume, and then raises
